These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide fragments of glutamic acid decarboxylase - for diagnosis and treatment of auto:immune disease, esp. Insulin dependent diabetes, also related nucleic acid, vectors, antibodies, hybridoma(s) etc.

          Amino acid sequences Y57063-Y57091 are examples of neglected target tissue antigens NTTAs. NTTAs are antigens (whole antigens or fragments) not involved in autoimmunity. These peptides and proteins are used in the method of the invention which involves administering an NTTA as an antigen based immunotherapeutic agent, to a host afflicted with an autoimmune response associated with an autoimmune disease. The immunotherapeutic agent is used to treat autoimmune diseases such as insulin dependent diabetes mellitus, multiple sclerosis, autoimmune thyroiditis, uveoretinitis, rheumatoid arthritis or abnormal inflammatory thyroiditis, uveoretinitis, rheumatoid arthritis or abnormal inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neglected target tissue antigen; NTTA; autoimmunity; autoimmune response; immunotherapeutic agent; insulin dependent diabetes mellitus; multiple sclerosis; autoimmune thyroiditis; rheumatoid arthritis; uveoretinitis; inflammatory response.
immune responses. The NTTA induces regulatory tolerance by elicitation regulatory T cells among T cells recognizing the NTTA but not

                                                                               participating in the immune response. The NTTA are capable of recognition by substantial populations of uncommitted T cells which can be primed, or blased, towards regulatory responses to provide effective treatment. The NTTA are effective in regulating undesirable immune responses even when target determinants used as agents promoting tolerance agents have failed to induce an effective regulatory T cell response. NTTAs as agents promoting tolerance are anticipated to be safer than use of target
                                                            determinants.

Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and WPI; 1998-427679/36. autoimmune disease

Disclosure; Page 42; 51pp; English

RESULTATION OF THE PRINCE OF T w85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostat or condyloma acuminatum). Helper T-cell peptides may be used to induce a helper T cell response, e.g. in cases of autoimmun prostate ដ for

Sequences Y73087-Y73102 represent hepatitis C virus (HCV)-derived MHC class II (HTL) epitopes which are claimed for use in the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper T lymphocyte (HTL) epitopes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    promoter; major histocompatibility complex; MHC; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTL; immune response; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HHY; HBY; HCY; hepatilis B, hepatitis C, bacterium; protozoan; tumour cell; autoimmune disease; activation; antiviral; antimalarial;

The present peptide is an antigenic peptide (AP), derived from the C-terminal region of the hepatitis C virus (HCV) non-structural protein 4 (NS4). The AP was prepd. using FMOC chemistry, and can be used in a claimed method for the differential diagnosis of HCV. One, two or three of the peptides W01980-82 are separately contacted with an antibody (Ab) conty. sample, and the binding between the peptide(s) and the Ab determined. The Ab conty. sample is then contacted with the peptide W01983, and the binding between the peptide and the Ab determined. The strength of the binding between the peptide(s) and the Ab in the two assays is compared, where stronger binding in the 1st assay is indicative of acute HCV infection, and equivalent binding is indicative of chronic HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or a cytotoxic T lymphocyte (CTL) epitope and a universal HTL epitope such as a pan DR epitope (PADRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in assaying the human immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HCV)) bacteria, protozoa (e.g., plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                 (USSH)

                                          Sequences Y73087-Y73102 represent hepatitis C virus (HCV)-derived MHC class II (HTL) epitopes which are claimed for use in the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric; pan DR epitope; expression vector; parting; peptide; promoter; major histocompatibility complex; MHC; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endopytic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTL; immune typonse; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HTV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell;
                epitopes may comprise either helper T lymphocyte (HTL) epitopes, or a cytotoxic T lymphocyte (CTL) entires.
                                                                                                                                                                                                                                   Claim 11;

They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HCV)) bacteria, protozoa (e.g., plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                           The synthetic peptide corresponds to residues 1917-1940 of the NS4 domain of HCV. The peptide may be used for the sensitive and specific detection of HCV infection Antibodies raised against the peptide can be used for passive immuno-prophylaxis and the HCV antispens can be used in vaccines to prevent HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of hepatitis C virus antigens - using antibody bound to solid support and competitive % \left( 1\right) =\left( 1\right) +\left( 1\right) +\left(

                                                                                                                                                          CC two-dimensional array of features. The method can be used for screening, condingnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally confidentiation of features; (b) identifying at least one chosen confident whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from cone or more persons without RA, where the relative abundance of the chosen feature of the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-compositic protein isoforms (RPIS), and for production of antibodies to diagnostic protein isoforms (RPIS), and for production of antibodies to compounds that promote or inhibit their activity, which are then used as CC RA drugs. Nucleic acid encoding RADFs can be used in gene therapy contocols, Y41844 to Y42100 represent RPI peptides, Y42101 to Y42103 corposent expression reference protein isoform peptides and 225066 to contocols, Y42100 represent protein isoform peptides and 225066 to contocols.

                                                                                                                                                                w85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HIA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate cancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis,
                                                                                                                                                                                                                                                                                                                                                                                         Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Helper T-cell peptide; human leucocyte antigen; HLA; DR4 DR7; cytotoxic T lymphocyte; CTL; hepatitis; autoimmune acquired immune deficiency syndrome; malaria; cancer; allograft rejection; allergy; Lyme disease; hepatitis; post-streptococcal endocarditis; glomerulonephritis;

CC histocompatibility complex (MHC) targetting sequence, and two or more characteristic periodes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to ca cytosolic pathway or to the endoplasmic reticulum, or an MHC class I targetting sequence, which directs extracellular antigens to care the endocytic pathway to be processed into antigen peptides complete the endocytic pathway to be processed into antigen peptides complete may comprise either helper I lymphocyte (HTL) epitopes, complete may comprise either helper I lymphocyte (HTL) epitopes, complete as a pan DR epitope (ETL) epitope and a universal HTL complete set as epitope endopes are actionated as a pan DR epitope (ETL) epitope and a universal HTL complete set as epitope (PADRE). The vectors are useful complete set in management of a non-human mammal. They provide a nucleic acid vaccine for complete in a non-human mammal. They provide a nucleic acid vaccine for complete in a non-human mammal. They provide a nucleic acid vaccine for complete the set of malaria) and also tumour cells and complete the set of malarial and also tumour cells and complete of cause of malarial and also tumour cells and complete of complete of collections are advantageously complete the target are advantageously complete of collections are advantageously complete of collections are advantageously complete the target are advantageously complete of collections are advantageously comp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
Peptide compsns. comprise at least one and pref. a combination two, three, four or more biotinylated peptides chosen from the sequences given in R41058-R41166. The peptides represent immunologically important regions of viral proteins and are prepd. by solid phase peptide synthesis. The compsns. are useful for the detection of antibodies to HCV, and/or HIV,
                                                                                                                                                                                                                                                 New biotinylated peptide(s) corresp. to immuno commentatione(s) - with increased antigenicity, useful in antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        06-MAR-1992;

                                                                                                                            The inventors claim a polypepide having a mol. wt. of about 35kd-42kd and having at least one of the SQ in P60743-P60746. In P60743-P60746, X in the SQ corresp. to an AA such that the SQ is substantially the same as a polypeptide expressed by an HTLV, esp. HTLV-I or HTLV-II (see P60747-P60749). Also claimed is a polypeptide having a mol. wt. of not greater than about 42kd and having an AA SQ of at least 12 AAs found within at least one of the polypeptide SQ in P60743-P60746. Polypeptides encoded for in the region described as pX-IV in the XSQ of HTLV-II are characterized by being respectively about 40kd and 37kd. Detection of antibodies to these proteins in serum may be used to determine whether exposure to an HTLV-IV in the SQ COUNTER ABSOCCULTER.
                                                                                                                                                                                                                                                                                                                                 New retroviral polypeptide(s), fragments antisera and antibodies - useful for detection of retro:viruses in HTLV family, e.g. causing adult T-cell leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2 encoded by the X-region of viruses in the HTLV family, \mathtt{HTLV-I} and \mathtt{HTLV-II}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and/or HTLV-I or II.

                                                                                                                                                                                                             g
                                                                                                                                                                                                                                The peptide corresponds to a glutamic acid decarboxylase (GAD 65) sequence and may be used for the detection of autoantibodies to GAD 65. They can also be used for screening drugs such as those that alter GAD function and for generation of antibodies which can be used to detect GAD 65. Such methods can be used in the diagnosis and therapy of autoimmune diseases such as insulin dependent diabetes mellitus and "stiff man" syndrome. The polypeptide can be used to bind or block the continuance of an autoimmune response to GAD 65. It may also be coupled to therapeutic agents and used immunotherapeutically. See also R29625-9.

                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is an antigen of the gp160 env precursor protein of HIV-1 group O (Outlier) strain KGT008, an isolate from Nigeria. The invention relates to new HIV-1 group O antigens (see Y0546-625), and the use of these antigens, or nucleic acids encoding them (see X25154-80), in the diagnosis and prophylaxis of AIDS. They can be used as reagents for detecting HIV-1 group O infection and for differentiating different types of HIV-1 group O infection. Vaccines that provide protective immunity against HIV-1 infection, in particular against HIV-1 group O infection, comprise at least one HIV-1 type O antigen, a nucleic acid encoding such an antigen, a virus-like particle comprising such an antigen, or an attenuated form of an HIV-1 type O strain. The invention also relates to new HIV-1 group O strains, mostly from patients from C cameroon and its neighbouring countries.

                                                                                                                                                                                                                                                                                                                                        Ωy
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents an immunogenic peptide used to produce cantibodies which will bind to the p20 region of ICH-3 from the present convention. The present invention describes: (1) a method for modulating programmed cell death in a cell, comprising contacting the cell with computating amounts of ICH-3; (2) a method for promoting pro-interleukin (pro-IL) 1-beta processing by a cell in the presence of IL-converting cenzyme (ICE), comprising contacting the cell with ICH-3 expressed under the control of a CMV promoter; (3) a method for stimulating synthesis of Ich-3 gene products in a cell, comprising contacting the cell with CC stimulatory amounts of Ilpopolysaccharide (LPS); (4) a monoclonal or polyclonal antibody that specifically binds to ICH-3; (5) a transgenic con-human animal, comprising a disrupted Ich-3 gene, and its progeny, and (6) a method of protecting against lung injury in common medical conditions, comprising utilising inhibitors of the pathway of apoptosis. The transgenic animal is used as model for the study of septic shock or infection. It is also used for screening for folliculogenic compounds or usceptibility to infection. Inhibitors of ICH-3 are used to reduce

The sequences given in R49291-505 and R46981-7038 represent peptide fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MMC) class II allotype. These peptides may be used for therapy of autoimmune diseases, such as

                                                                                         This sequence is a fragment of the AV37 antigen protein of the invention. The protein is recognised by a monoclonal antibody (MAb) secreted by the hybridoma AV37 deposited at the European Collection of Cell Cultures (ECACC) accession number 98030304. The polypeptide can be used to isolate a MAb, produce a hybridoma producing the MAb, and in a composition for use as a vaccine. The vaccine can be used against oncogenic avian viruses, including Marek's disease virus, avian leucosis virus, Rous-associated virus and reticuloendotheliosis virus. The vector can be

Submitted (NOV-1994) to the EMBL/GenBank/DDBJ databases.

FUNCTION: MEMBER OF CAK WHICH ACTIVATES CYCLIN-ASSOCIATED CDC2/CDK2/CDK4 BY THREONINE PHOSPHORYLATION. ITS EXPRESSION AND ACTIVITY ARE CONSTANT THROUGHOUT THE CELL CYCLE. CAK IS TIGHTLY ASSOCIATED WITH A MULTIFROTEIN COMPLEX TFIIH, WHICH PLAYS A DUAL ROLE IN TRANSCRIPTION AND DNA REPAIR (BY SIMILARITY).

ROLE IN TRANSCRIPTION AND DNA REPAIR (BY SIMILARITY).

1- SUBURIT: MAMMALIAN CAK CONTAINS THREE COMPONENTS: CDK7, CYCLIN HAND AN ASSEMBLY FACTOR CALLED MAT1.

-1- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                             ö
                                             decarboxylase and specifically reacts with a T-cell sub-population isolated from recently diagnosed Type: diabetics. Pharmaceutical composns. conty, this peptide and those shown in R88667 and R76642-62, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn., e.g. by reinjection.
                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Q86481 and Q86482 encode R71733 and R79105, rat and human glutamic acid decarboxylase (GAD65) respectively, from which the GAD65 fragments described in R72261-R72298 were derived. These fragments can be used to detect autoontibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.
                                                                                                                                                                                                             ö
                                  R88668 is derived from residues 306-325 of human glutamic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide fragments of glutamic acid decarboxylase - for diagnosis and treatment of auto:immune disease, esp. insulin dependent diabetes, also related nucleic acid, vectors, antibodies, hybridoma(s) etc.
                                                                                                                                                                                   Length 20;

                                       This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that immunoassays. GAD65 is an effective diagnostic tool for predicting nom the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are

NAME OF THE PROPERTY OF THE PR

```
specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. these peptides and those shown in R88668-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,

The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at e.g. atherosclerotic streaks, and to raise antibodies. Y18934 to Y19187 represent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecithin:roblesterol acyltransferase; LGMT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an agonist (A) of apolipoprotein A-I dapoal) which is a 14-22 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with disklipidemia, specifically hypercholesterolaemia, rardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock, when labeled, (A) can also be used disponsitionly to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lecithin: cholesterol acyltransferase activation exhibiting peptide #129.

                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                              decarboxylase (GDD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

The present invention describes a nucleic acid (A) encoding an apolipoprotein A-I (apoA-I) agonist (B) that is a peptide, or analog, which forms an amphipathic alpha-helix in presence of lipids. (A), optionally as a complex with lipids, and host cells that contain (A), are useful for gene therapy, or prevention, of diseases associated with a therosclerosis, specifically hypercholesteroleamia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) and apoA-I deficiency, hypertriglyceridemia and metabolic syndrome, also to treat endotoxemia (spetic shock). Host cells containing (A) can also be used to study the role of apoA-I in lipid metabolism. (B) can be used diagnostically, e.g. to measure serum HDL (particularly its subpopulation involved in retrograde cholesterol transport) and for imaging the circulatory system or HDL accumulations at fatty streaks. The present sequence represents a peptide from the present invention.
                                                                                                                                              ö

The present invention describes an agonist (A) of apolipoprotein A-I (apoA-I) which is a 15-29 residue peptide, or analog, that forms an amphipathic alpha-helix in presence of lipids. (A), and their lipid complexes, are used to treat or prevent diseases associated with dyslipidemia, specifically hypercholesterolaemia, cardiovascular disease, atherosclerosis, restenosis, HDL (high density lipoprotein) or apoA-I deficiency; hypertriglyceridemia and metabolic syndrome, also for treating septic shock. When labeled, (A) can also be used diagnostically to measure serum levels of HDL, in particular the HDL subpopulation that is involved in retrograde cholesterol transport, also to image HDL at tepresent lecithin:cholesterol acyltransferase (LCAT) activity exhibiting core peptides, which are apoA-I agonists.
                                                                                                                                                                                                 Apolipoprotein A-I; agonist; dyslipidemic disorder; dyslipidemia; human; lecithin:roblesterol acyltransferase; LGAT; hypercholesterolaemia; cardiovascular disease; atheroseclerosis; restenosis; HDL; apoA-I; high density lipoprotein; hypertriglyceridemia; metabolic syndrome;
                                                                                                                                                                      Lecithin:cholesterol acyltransferase activation exhibiting peptide #129.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ΰ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Metz

The products of the invention and their encoding nucleic acids may be useful for treating diseases and conditions related to aging, cellular differentiation, physical insult (e.g. physical trauma, anoxia, hyperthermia, hypothermia, chemically induced damage, and trauma to the brain, spinal cord, kidney, heart, lungs, liver, skin and any other organ), viral disorders (e.g. hepatitis, retroviral infections, viral encephalitis, and AIDS/HIV), neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease, Huntington's disease, cerebellar degenerations, and familial amyotrophic lateral sclerosis (FALS)), cardiovascular disease (e.g. atherosclerosis, myocardial infarction, heart failure, cardiomyopathy, myocardial reperfusion injury, and hypertensive heart disease), immune disease (e.g. rheumatoid
